PROCEEDINGS
XX CONGRESS OF THE
CARPATHIAN-BALKAN
GEOLOGICAL ASSOCIATION

SEPTEMBER 24-26, 2014
TIRANA, ALBANIA

Editors
Beqiraj A.
Ionescu C.
Christofides G.
Uta A.
Beqiraj Goga E.
Marku S.

Special Issue
Vol 1/2014
Special Sessions

TIRANA 2014
CBGA COUNCIL

President: Arjan Beqiraj (Albania)
Secretary General: Arben Pambuku (Albania)

COUNCILLORS (NATIONAL REPRESENTATIVES)

Albania  Arjan Beqiraj
Austria  Volker Hoeck
Bosnia and Herzegovina  Zehra Salkic
Bulgaria  Irena Peycheva
Czechia  Lilian Svabeicka
FYROM  Blazo Boev
Greece  Georgios Christofides
Hungary  Geza Csaszar
Montenegro  Slobo Radusinovc
Poland  Alfred Uehman
Romania  Corina Ionescu
Serbia  Ljupko Rundić
Slovakia  Milan Kohut
Slovenia  Mirka Trajanova
Ukraine  Myroslav Pavlyuk

CBGA BOARDER

Arjan Beqiraj (Albania)
Arben Pambuku (Albania)
Georgios Christofides (Greece)
ORGANIZING COMMITTEES

Arjan Beqiraj, President of CBGA

Vice President
Viktor Doda, Director of Geological Survey of Albania

Secretary General
Arben Pambuku, Secretary of CBGA

Executive Secretary
Andreea Uta

Treasurer
Olgert Jaupa

MEMBERS

Jorgaq Kaçani – Rector of Polytechnic University of Tirana
Perparim Hoxha – Dean of Faculty of Geology and Mining
Salvatore Bushati – Academy of Science of Albania

Adil Neziraj         Gjovalin Leka
Alexandros Chatzipetros       Lavdie Moisiu
Altin Karriqi              Lejla Hadziç
Bardhyl Muceku              Mirka Trajanova
Blerta Serjani              Ontion Fociro
Enkeleida Goga Beqiraj       Shkelqim Daja
Enton Bedini                      Flora Progni
                                     Sokol Marku

INTERNATIONAL SCIENTIFIC COMMITTEE

Afat Serjani         Kristaq Muska
Agim Sinojmeri         Ladislav Palinkas
Aleksander Çina        Llambro Duni
Alfred Frasheri       Maryse Ohnenstetter
Alfred Uchman         Meni Prela
Andreas Luttge         Milan Kohut
Artan Tashko            Milan Sudar
Corina Ionescu          Minella Shallo
Dritan Siliqi          Nikolla Konomi
Eleni Gjani             Perparim Ahikaj
Emilio Saccani       Resmi Kamberaj
Engjell Prejzani      Romeo Eftimi
Friedrich Koller         Ryszard Kryza
Georgios Christofides    Selam Meco
Géza Császár            Vangjel Melo
Ibrahim Milushi         Vilson Sillo
Ilir Alliu               Volker Hoeck
Kadri Gjata             Yotzo Yanev

FIELD TRIP SUBCOMMITTEE

Avni Mesi         Irakli Priphi
Cerçis Durmishi     Kujtim Onuzi
                     Shaqir Nazaj

THE ILOVITSA PORPHYRY Cu-AU DEPOSIT: VEIN SEQUENCE, SULFIDE DEPOSITION AND 
FLUID INCLUSION STUDY

Abstract

The Ilovitsa porphyry Cu-Au deposit is located 30 km away from the town of Strumitsa, SE FYR Macedonia. It is hosted in a Triassic granite (251.90 ±0.89 Ma, Georgiev et al. 2013). The latter intrudes into the metamorphic rocks of the Vertiscos-Ograzhden Unit of the Serbo-Macedonian massif. Formation of the Ilovitsa deposit is related to the intrusion of multiple Tertiary porphyry intrusions (called the Ilovitsa Stock) and dykes. The Ilovitsa stock that hosts the Cu-Au mineralization is made up by two main intrusions with a similar granodioritic composition dated by ID-TIMS at 30.31 ±0.05 Ma and 30.13±0.03 Ma (Georgiev et al. 2013). The authors have determined that the ages of the dykes are between 28.8 and 29.6 Ma.

The main goal of the present study is to distinguish the relative timing of different vein types, vein minerals and related hydrothermal alteration. In addition, we determined the temperature conditions of their formation based on a fluid inclusion study where appropriate fluid inclusion assemblages were found. For that purpose 7 drill holes were sampled and around 80 samples were collected for laboratory analyses. Cross-cutting relationships were used to distinguish the relative timing of vein formation. SEM-CL petrography was then used for identification and textural correlation between successive quartz types, sulfides and fluid inclusion assemblages. Representative fluid inclusion assemblages were selected for further analyses by microthermometry. Hydrothermal veins were named according to their mineral assemblages and quartz textures. All analyses were performed at ETH Zurich.

We have distinguished several successive vein types: Magnetite or quartz-magnetite veinlets are up to few cm thick with potassic alteration. Quartz, where present, is granular with a homogeneous CL-gray luminosity. Barren quartz veins are divided into two subtypes: granular and crystalline quartz veins. Granular quartz veinlets are thin, with irregular walls and are related to potassic alteration. The quartz grains are anhedral with CL-dark luminescence. Crystalline quartz veins are composed of subhedral to euhedral quartz crystals that have oscillatory zoning ranging in luminosity from CL-gray to CL-bright. Data from microthermometry of brine inclusions show that they were formed at temperature higher than 600 °C. Generally, these veins were reopened and filled with minerals from later mineral assemblages in the central parts. Magnetite-bornite-chalcopyrite veinlets are rare in Ilovitsa. Pyrite-chalcopyrite±hematite form thin veinlets cutting the earlier vein types. Inclusions of gold in chalcopyrite are observed. These veins typically contain only minor amounts of CL-dark luminescent quartz. Fluid inclusions suitable for microthermometry undoubtedly connected to the formation of this quartz were not found that is why we could not constrain the temperature of formation of these veins. Quartz-molybdenite veins commonly contain open spaces lined by euhedral quartz crystals with oscillatory zoning. Generally, symmetric lines of molybdenite flakes, growing adjacent to the vein walls, are observed. Based on microthermometry of brine inclusions, we determined that these veins are high temperature (T > 600°C). Quartz-pyrite veins with sericitic alteration cut all of the above described veins. These veins contain only small amounts of CL-dark luminescent quartz and pyrite. Microthermometry data of two-phase fluid inclusions showed that they were formed at a temperature around 290°C. Quartz-galena-sphalerite±pyrite, chalcopyrite veins are widely distributed in Ilovitsa. Quartz forms idiomorphic crystals with oscillatory zoning. Microthermometry data of two-phase fluid inclusions trapped in sphalerite crystals show temperatures between 300 °C and 270 °C. Quartz-carbonate veins were formed during a post-ore stage. Carbonates are found in thin veinlets as well as in veins of earlier formed veins.
