MATHCAD FILE FOR SIMULATION OF SIMPLE SURFACE Ox(ads) + ne- = Red(ads) Protein-film Mechanism in CYCLIC VOLTAMMETRY

Rubin Gulaboski, Valentin Mirceski

Abstract

Reaction of protein-film voltammetry Ox(ads) + ne- = Red(ads), in which both participants are firmly adsorbed at the working electrode surface is considered cylcic voltammetry. This model is analogue of a surface simple electrode mechanism. We give the readers entire working MATHCAD file to simulate this mechanism under conditions of cyclic voltammetry. The features of simulated voltammograms is function of number of exchanged electrons, electron transfer coefficient, potential step, and on dimensionless parameter related to the kinetic of electron transfer, defined as KI = ksτ, where ks is standard rate constant of electron traansfer and 'τ' is the time duration of potential step in cyclic voltammetry.
