Under the auspices of

## Abstract Book

## Oral Presentations

(in alphabetical order, as per session codes)

|     |   |     |   |
|-----|---|-----|---|
| 6   | AH-1: Aerosol emissions and sources   | 185 | AT-6: Aerosol Measurement Techniques, Filtration and Industrial Aerosols        |
| 14  | AH-2: Novel metrics and tools   | 192 | AT-7: Synthesis, structuring and applications of functional nanoparticles III   |
| 22  | AH-3: Occupational exposures  | 199 | ATAS-1: Polar aerosols and clouds   |
| 29  | AH-4: Organic aerosols: from emissions to toxicity assessment                     | 207 | ATAS-2: Source apportionment of urban aerosol                                   |
| 37  | AH-5: Health impacts and impact assessment of exposure to airborne particles      | 215 | ATAS-3: Aerosol-cloud interaction: Observations                                 |
| 44  | AH-6: Aerosol inhalation and deposition studies                                   | 223 | ATAS-4: Characterization of non-exhaust aerosol                                 |
| 52  | AH-7: Bioaerosol: monitoring, emissions and exposure                              | 230 | ATAS-5: Aerosol-cloud interaction: Observations and modelling                   |
| 60  | AH-8: Human exposure in urban environments  | 238 | ATAS-6: Secondary organic aerosols  |
| 67  | AMT-1: Low-cost sensors   | 246 | ATAS-7: Chemistry in a multiphase aerosol system                                |
| 75  | AMT-2: Measurement Techniques for health relevant aerosols                        | 253 | ATAS-8: Radiative impacts of aerosols   |
| 83  | AMT-3: Particle detection by optical and condensational means                     | 261 | ATAS-9: Transport of aerosols: Modelling and observations                       |
| 91  | AMT-4: Measurement techniques for ambient air                                     | 269 | ATAS-10: Chemical profiling of organic aerosols at the molecular level          |
| 97  | AMT-5: Comparison of different measurement techniques                             | 277 | ATAS-11: Chemical characterization of atmospheric carbonaceous aerosols         |
| 105 | AMT-6: Electrical and mechanical sizing techniques                                | 284 | ATAS-12: Spatio-temporal variability of aerosol optical properties              |
| 113 | AMT-7: Novel Measurement Techniques I   | 292 | ATAS-13: Chemical characterization and modelling of carbonaceous aerosols       |
| 121 | AMT-8: Novel Measurement Techniques II  | 300 | ATAS-14: Source apportionment of carbonaceous aerosol                           |
| 129 | AMT-9: Novel Measurement Techniques III   | 308 | ATAS-15: Source apportionment at high resolution                                |
| 137 | AMT-10: Measurement techniques for carbonaceous particle                          | 317 | ATAS-16: Long-term trends and long-range transport of aerosols                  |
| 145 | AT-1: Synthesis, structuring and applications of functional nanoparticles I       | 324 | ATAS-17: Source apportionment in different regions I                            |
| 153 | AT-2: Synthesis, structuring and applications of functional nanoparticles II      | 332 | ATAS-18: Atmospheric new particle formation: Field observations and lab studies |
| 161 | AT-3: Transportation aerosol emissions and control technologies                   | 340 | ATAS-19: Source apportionment in different regions II                           |
| 169 | AT-4: Combustion generated aerosols, spark ablation, and electrostatic properties | 348 | ATAS-20: New particle formation and atmospheric ice nucleation                  |
| 177 | AT-5: Nanoparticle surface modification, deposition and thin film formation       | 356 | ATAS-21: Source apportionment of organic aerosol                                |

|     |  |     |  |
|-----|--|-----|--|
| 362 | ATAS-22: Brown carbon optical properties and radiative effects                   | 440 | BAP-5: Aerosol transport properties and fluid dynamics                   |
| 370 | ATAS-23: Physico-chemical properties of ambient aerosols                         | 448 | BAP-6: Physical properties of aerosols                                   |
| 377 | ATAS-24: Connecting aerosol physico-chemical and optical properties I            | 456 | SS-1: Quantification of health risk from airborne particulate pollutants |
| 385 | ATAS-25: Mechanistic understanding of SOA formation and transformation processes | 464 | SS-2-A: COVID-19, aerosols, and ventilation I                            |
| 393 | ATAS-26: Physico-chemical properties of laboratory aerosols                      | 472 | SS-2-B: COVID-19, aerosols, and ventilation II                           |
| 401 | ATAS-27: Connecting aerosol physico-chemical and optical properties II           | 479 | SS-3: Advanced aerosol metrology for atmospheric science and air quality |
| 408 | BAP-1: Smog chamber and flow tube simulations and experiments                    | 487 | SS-4: Aerosols in agriculture and livestock sectors                      |
| 416 | BAP-2: Molecular-level studies of aerosol formation and gas-phase kinetics       | 495 | SS-5-A: Oxidative potential of aerosols particles and health risks I     |
| 424 | BAP-3: Modelling aerosol processes I   | 503 | SS-5-B: Oxidative potential of aerosols particles and health risks II    |
| 432 | BAP-4: Modelling aerosol processes II  |     |  |

## Poster Presentations

(in alphabetical order, as per session and codes)

### POSTER SESSION 1

|     |   |      |   |
|-----|---|------|---|
| 512 | AH-P1: Health effects of aerosols                             | 896  | AMT-P3: Novel and low cost instrumentation  |
| 530 | AH-P2: Bioaerosols  | 941  | ATAS-P3: Aerosols, clouds, and new particle formation   |
| 549 | AMT-P1: Instrumentation for aerosol characterization          | 996  | ATAS-P4: Atmospheric aerosol transport and modelling  |
| 583 | AMT-P2: Measurement techniques                                | 1028 | ATAS-P5: Atmospheric aerosol properties and characterization                                  |
| 625 | AT-P1: Functional nanoparticles                               | 1091 | AT-P2: Electrical effects   |
| 666 | ATAS-P1: Aerosol chemistry                                    | 1103 | AT-P3: High temperature aerosols and filtration   |
| 705 | ATAS-P2: Source apportionment and air quality                 | 1111 | AT-P4: Aerosol emissions and control technologies   |
| 800 | BAP-P1: Heat and mass transfer: Experiments and simulations   | 1130 | BAP-P3: Modelling of internal and external aerosol processes                                  |
| 813 | BAP-P2: Quantum chemistry of aerosol formation                | 1155 | BAP-P4: Physical properties of aerosol particles  |
| 819 | LP-P1: Late Posters 1   | 1161 | LP-P2: Late Posters 2   |
| 825 | SS2-P1: Special Session-2: COVID-19, aerosols and ventilation | 1168 | SS1-P1: Special Session-1: Quantification of health risk from airborne particulate matter     |
|     |   | 1175 | SS3-P1: Special Session-3: Advanced aerosol metrology for atmospheric science and air quality |

### POSTER SESSION 2

|     |   |      |  |
|-----|---|------|--|
| 850 | AH-P3: Exposure: Sources and health studies | 1183 | SS4-P1: Special Session-4: Aerosols in the agriculture and livestock sectors         |
|     |   | 1188 | SS5-P1: Special Session-5: Oxidative potential of aerosol particles and health risks |

### VIRTUAL POSTERS

|      |   |      |  |
|------|---|------|--|
| 1209 | <a href="#">AH-eP1: Health effects of aerosols</a>                            | 1356 | <a href="#">AT-eP1: Functional nanoparticles</a>   |
| 1216 | <a href="#">AH-eP2: Bioaerosols</a>   | 1363 | <a href="#">AT-eP2: Electrical effects</a>   |
| 1228 | <a href="#">AH-eP3: Exposure: Sources and health studies</a>                  | 1366 | <a href="#">AT-eP3: High temperature aerosols and filtration</a>   |
| 1242 | <a href="#">AMT-eP1: Instrumentation for aerosol characterization</a>         | 1368 | <a href="#">AT-eP4: Aerosol emissions and control technologies</a>   |
| 1254 | <a href="#">AMT-eP2: Measurement techniques</a>                               | 1371 | <a href="#">BAP-eP1: Heat and mass transfer: Experiments and simulations</a>                                   |
| 1263 | <a href="#">AMT-eP3: Novel and low cost instrumentation</a>                   | 1374 | <a href="#">BAP-eP3: Modelling of internal and external aerosol processes</a>                                  |
| 1276 | <a href="#">ATAS-eP1: Aerosol chemistry</a>                                   | 1375 | <a href="#">BAP-eP4: Physical properties of aerosol particles</a>  |
| 1287 | <a href="#">ATAS-eP2: Source apportionment and air quality</a>                | 1377 | <a href="#">SS1-eP1: Special Session-1: Quantification of health risk from airborne particulate matter</a>     |
| 1321 | <a href="#">ATAS-eP3: Aerosols, clouds, and new particle formation</a>        | 1383 | <a href="#">SS2-eP1: Special Session-2: COVID-19, aerosols and ventilation</a>                                 |
| 1336 | <a href="#">ATAS-eP4: Atmospheric aerosol transport and modelling</a>         | 1386 | <a href="#">SS3-eP1: Special Session-3: Advanced aerosol metrology for atmospheric science and air quality</a> |
| 1342 | <a href="#">ATAS-eP5: Atmospheric aerosol properties and characterization</a> | 1389 | <a href="#">SS4-eP1: Special Session-4: Aerosols in the agriculture and livestock sectors</a>                  |
|      |   | 1392 | <a href="#">SS5-eP1: Special Session-5: Oxidative potential of aerosol particles and health risks</a>          |

11<sup>th</sup> International Aerosol Conference

Oral Presentations

ATHENS  
Greece **IAC 2022**

## ATAS-4: Characterization of non-exhaust aerosol

- ATAS-4-01**      **Non-exhaust emissions from road traffic in Lisbon: Characterization and pollution indexes**  
**INES CUNHA-LOPES<sup>1</sup>, Celia Alves<sup>2</sup>, Ismael Casotti Rienda<sup>2</sup>, Tiago Faria<sup>1</sup>, Franco Lucarelli<sup>3</sup>, Xavier Querol<sup>4</sup>, Fulvio Amato<sup>4</sup>, Susana Marta Almeida<sup>1</sup>** | <sup>1</sup>Centro De Ciencias E Tecnologias Nucleares, Instituto Superior Tecnico, Universidade De Lisboa, Portugal; <sup>2</sup>Centre of Environmental and Marine Studies, Department of Environment, University of Aveiro, Portugal; <sup>3</sup>INFN - Firenze, National Institute for Nuclear Physics - Florence division, Italy; <sup>4</sup>Institute of Environmental Assessment and Water Research, Spanish Research Council (IDAA-CSIC), Barcelona, Spain
- ATAS-4-02**      **Quantifying non-exhaust emissions in the UK using combined measurement and modelling approaches**  
**WILLIAM HICKS<sup>1</sup>, Sean Beevers<sup>1</sup>, Max Priestman<sup>1</sup>, Anja Tremper<sup>1</sup>, Annalisa Sheehan<sup>1</sup>, James Allan<sup>2</sup>, Michael Flynn<sup>2</sup>, William Bloss<sup>3</sup>, David Green<sup>1</sup>** | <sup>1</sup>Imperial College London, United Kingdom; <sup>2</sup>Department of Earth and Environmental Sciences, Manchester, United Kingdom; <sup>3</sup>School of Geography, Earth and Environmental Sciences, University of Birmingham, United Kingdom
- ATAS-4-03**      **Sources of ambient particulate matter in Skopje urban area**  
**DEJAN MIRAKOVSKI, Blazo Boev, Afrodita Zendelska, Marija Hadzi-Nikolova, Ivan Boev, Tena Shijakova** | University "Goce Delcev", Stip, North Macedonia
- ATAS-4-04**      **Non-exhaust traffic emissions: a size-segregated field study and development of a road dust sampling device**  
**FEDERICA CROVA<sup>1</sup>, Vera Bernardoni<sup>1</sup>, Giulia Calzolai<sup>2,3</sup>, Maddalena Castelli Dezza<sup>1</sup>, Alice Corina Forello<sup>1,2</sup>, Luigi Gianelle<sup>4</sup>, Franco Lucarelli<sup>2,3</sup>, Silvia Nava<sup>2,3</sup>, Sara Valentini<sup>1</sup>, Gianluigi Valli<sup>1</sup>, Roberta Vecchi<sup>1</sup>** | <sup>1</sup>Department of Physics, Universita degli Studi di Milano and INFN-Milano, Italy; <sup>2</sup>Department of Physics and Astrophysics, Universita degli Studi di Firenze, Sesto Fiorentino, Italy; <sup>3</sup>INFN-Firenze, Sesto Fiorentino, Italy; <sup>4</sup>ARPA Lombardia, Milan, Italy
- ATAS-4-05**      **Size and time-resolved source contributions and oxidative potential of non-exhaust sources in Barcelona**  
**ANGIE ALBARRACIN MELO<sup>1</sup>, Angeliki Karanasiou<sup>1</sup>, Barend L. Van Drooge<sup>1</sup>, Veronica Moreno<sup>1</sup>, Xavier Querol<sup>1</sup>, Natalia Moreno<sup>1</sup>, Oriol Font<sup>1</sup>, Rafael Bartroli<sup>1</sup>, Ana Oliete<sup>2</sup>, Frank Kelly<sup>2</sup>, Franco Lucarelli<sup>3</sup>, Giulia Pazzi<sup>3</sup>, Fabio Giardi<sup>3</sup>, Fulvio Amato<sup>1</sup>** | <sup>1</sup>Institute of Environmental Assessment and Water Research (IDAEA-CSIC), Barcelona, Spain; <sup>2</sup>Imperial College of London, United Kingdom; <sup>3</sup>University of Florence, Italy
- ATAS-4-06**      **Source Attribution and Magnitude Model: A new perspective for fugitive PM<sub>10</sub> emissions**  
**Greg Yarwood<sup>1</sup>, Bart Brashers<sup>1</sup>, Tasko Olevski<sup>1</sup>, Chris Atherly<sup>1</sup>, Martin Parsons<sup>2</sup>, RUTH PEIFFER<sup>3</sup>** | <sup>1</sup>Ramboll US Consulting, Novato, USA; <sup>2</sup>Ramboll Australia Pty Ltd, Perth, Australia; <sup>3</sup>BHP Iron Ore Pty Ltd, Perth, Australia

## Sources of ambient particulate matter in Skopje urban area

Dejan Mirakovski<sup>1</sup>, Blazo Boev<sup>1</sup>, Afrodita Zendelska<sup>1</sup>, Marija Hadzi-Nikolova<sup>1</sup>, Ivan Boev<sup>1</sup> and Tena Shijakova<sup>1</sup>

<sup>1</sup>Ambicon Lab, Faculty of Natural and Technical Sciences, University Goce Delcev, Stip, 2000, North Macedonia

Keywords: air pollution, particulate matter, source apportionment, PMF

Presenting author email: [dejan.mirakovski@ugd.edu.mk](mailto:dejan.mirakovski@ugd.edu.mk)

In recent years, high air pollution episodes in most of North Macedonia's cities have dominated the headlines, confirming popular view that dirty air is by far the most serious environmental and health issue confronting the country's urban population. The country's capital and most populous city Skopje is frequently at the top of numerous pollution rankings and is among the cities in Eastern Europe and Central Asia that significantly exceed the EU yearly limit value for PM 2.5. (Almeida *et al* 2020). However, the restricted scope and temporally scattered data about pollution sources, allow for scepticism, thwarting any efforts to apply effective abatement techniques.

Main goal of Source Apportionment (SA) study for Skopje Agglomeration was to derive information about pollution sources and the amount they contribute to ambient air pollution levels. The study includes selection of representative receptor/monitoring site, sampling, chemical speciation, and construction of multivariate receptor model, following the European Guide on Air Pollution Source Apportionment with Receptor Models, Revised version, JRC (2019).

Karposh urban background monitoring station, a part of national monitoring network, was selected as representative receptor exposed to the mix of sources in the urban area.

Sampling process was performed fully in line with the requirements of standard gravimetric measurement method for determination of the PM<sub>10</sub>/PM<sub>2.5</sub> mass concentration of suspended particulate matter (EN 12341:2014). The sampling program began on October 29, 2020 and finished on December 4, 2021. A total of 376 daily samples were obtained throughout this period.

The elemental analysis was conducted using energy dispersive X-ray fluorescence spectrometer Rigaku NEX CG according to the EPA/625/R-96/010a Compendium Method IO-3.3. Black Carbon or Elemental Carbon was determined using Magee Scientific, SootScan™ Model OT21 Optical Transmissometer with dual wavelength light source, by applying EPA empirical EC relation for Teflon FRM filters. Water-soluble ions, including sulphate (SO<sub>4</sub><sup>2-</sup>), nitrate (NO<sub>3</sub><sup>-</sup>), ammonium (NH<sub>4</sub><sup>+</sup>), were determined using internally developed extraction procedure and photometric methods.

Receptor model for PM 2.5 mass concentration was developed using positive matrix factorisation software, EPA PMF version 5.0.14. Data set included 34 species and 332 day samples. Analytical uncertainty

estimates by species and sample were provided from the lab. In addition to the analytical uncertainty, 10 % extra uncertainty was added to account for the sampling uncertainty.

In total 7 major factors that contribute to PM 2.5 mass were identified, including: traffic, industry, fuel oil burning, soil (mineral) dust, open fire burning, biomass burning and secondary aerosols.

Monthly source contributions for PM 2.5 at both sites clearly indicate high seasonal variability for most of the sources. As identified in previous works, biomass burning remain the largest single source of ambient air pollution, and due to specific temporal distribution, the main driver of high wintertime pollution episodes.

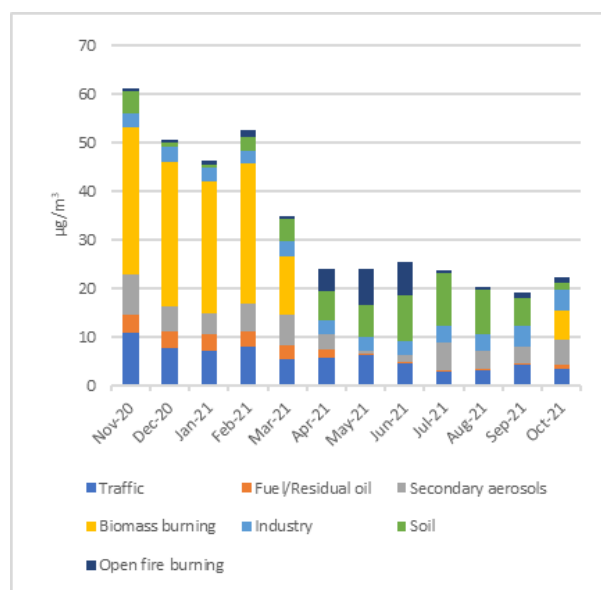

Figure 1. Monthly source contribution for PM 2.5

This work was performed as part of Tackling Air Pollution in the City of Skopje Project, implemented by UNDP-Skopje and SIDA- Sweden's government agency for development cooperation.
