# The role of chemistry in the development of the radiosynthesis methods for fluorine-18 radiopharmaceuticals

Maja Chochevska

26<sup>th</sup> Congress of SCTM - Sep, 2023

# Typical workflow of radiopharmaceuticals production

# Equipment for the Production of PET radionuclide

Targets for production of F-18, C-11 and N-13  
(with possibility of additional embedding of solid targets)

Isotope	Half-life	Production <sup>a</sup>	Mode of decay	Common source
<sup>18</sup> F	109.8 min	<sup>18</sup> O(p,n) <sup>18</sup> F	β <sup>+</sup> (97%), EC (3%)	Cyclotron
<sup>11</sup> C	20.4 min	<sup>14</sup> N(p,α) <sup>11</sup> C	β <sup>+</sup> (100%)	Cyclotron
<sup>13</sup> N	10 min	<sup>16</sup> O(p,α) <sup>13</sup> N	β <sup>+</sup> (100%)	Cyclotron
<sup>15</sup> O	2 min	<sup>15</sup> N(p,n) <sup>15</sup> O	β <sup>+</sup> (100%)	Cyclotron
<sup>124</sup> I	4.2 d	<sup>124</sup> Te(p,n) <sup>124</sup> I	β <sup>+</sup> (23%), EC (77%)	Cyclotron
<sup>44</sup> Sc	4.0 h	<sup>44</sup> Ti/ <sup>44</sup> Sc	β <sup>+</sup> (94%), EC (6%)	Generator <sup>b</sup>
<sup>64</sup> Cu	12.7 h	<sup>64</sup> Ni(p,n) <sup>64</sup> Cu	β <sup>+</sup> (17%), EC (44%), β <sup>-</sup> (39%)	Cyclotron <sup>c</sup>
<sup>68</sup> Ga	67.7 min	<sup>68</sup> Ge/ <sup>68</sup> Ga	β <sup>+</sup> (89%), EC (11%)	Generator <sup>d</sup>
<sup>82</sup> Rb	1.3 min	<sup>82</sup> Sr/ <sup>82</sup> Rb	β <sup>+</sup> (95%), EC (5%)	Generator
<sup>86</sup> Y	14.7 h	<sup>86</sup> Sr(p,n) <sup>86</sup> Y	β <sup>+</sup> (32%), EC (68%)	Cyclotron
<sup>89</sup> Zr	78.4 h	<sup>89</sup> Y(p,n) <sup>89</sup> Zr	β <sup>+</sup> (23%), EC (77%)	Cyclotron

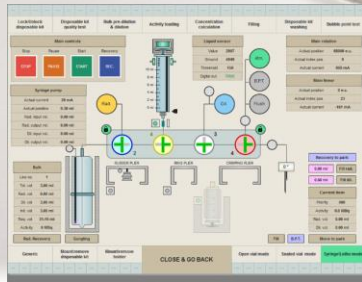

## F-18: physical and nuclear characteristics

- ✓ Low positron energy and short range in tissue (high resolution)
- ✓ 97% β<sup>+</sup> decay
- ✓ high specific activity
- ✓ can be produced in large amount in a cyclotron (>10 Ci)
- ✓ can be labeled in high radiochemical yields
- ✓ allow transportation from production site to PET centers (T<sub>1/2</sub>= 109.7 min)

**Cyclotron - 16,5 MeV GE PET Trace**

# Fluorine-18 chemistry

## $^{20}\text{Ne}(\text{d},\alpha)^{18}\text{F}$

A solid target is bombarded and fluorine-18 is obtained in the form of molecular fluorine gas

**Electrophilic substitution**  
(Electrophilic radiofluorination)

## $^{18}\text{O}(\text{p},\text{n})^{18}\text{F}$

A liquid target is bombarded - enriched water with  $^{18}\text{O}$ , and fluorine-18 is obtained in the form of fluoride anion

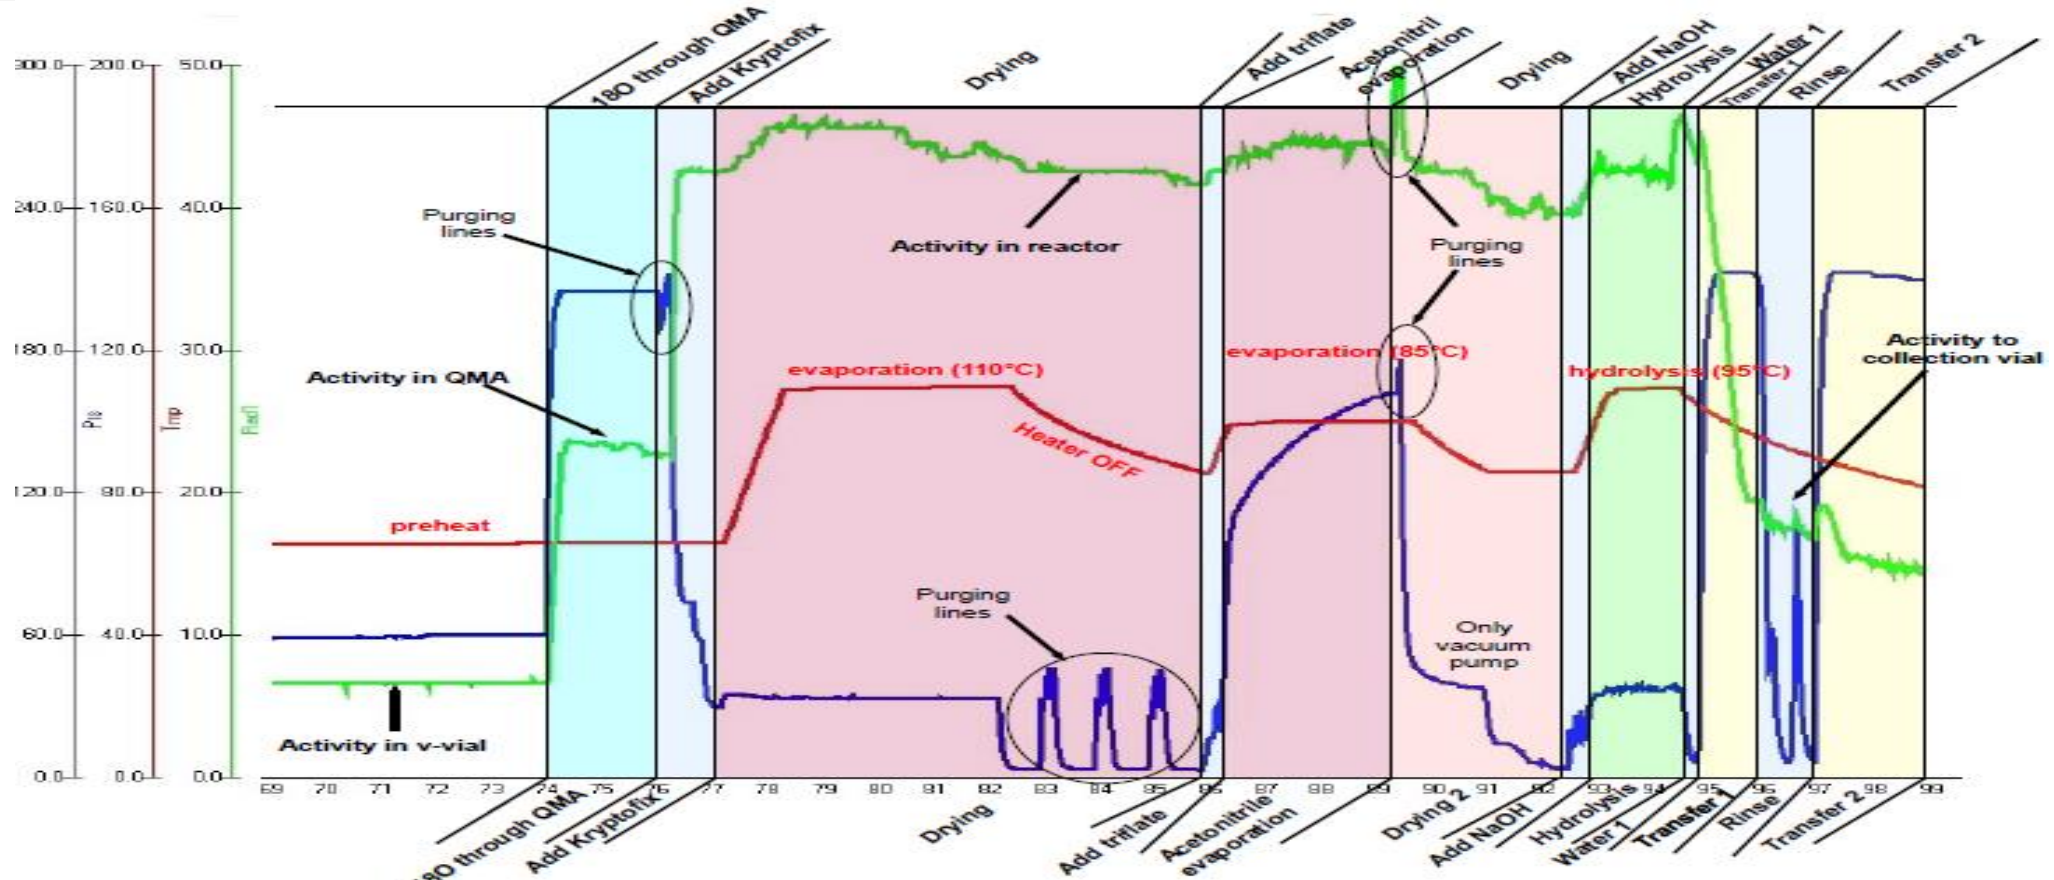

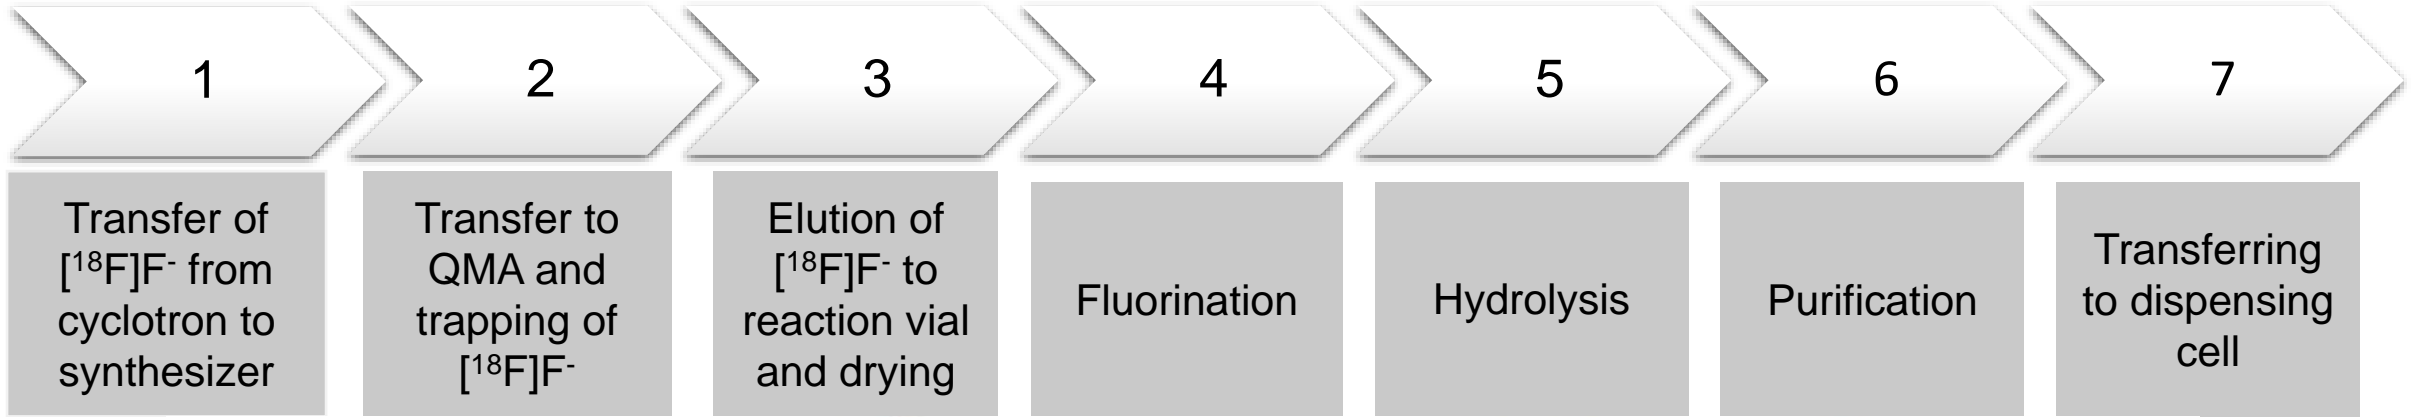

**Nucleophilic substitution**  
(Nucleophilic radiofluorination -  $\text{S}_{\text{N}}2$  or  $\text{S}_{\text{N}}\text{Ar}$ )

The utilization of nucleophilic  $[^{18}\text{F}]\text{F}^-$  ions in the F-18 radiopharmaceutical synthesis process has many advantages over fluorine gas  $[^{18}\text{F}]\text{F}_2$

Electrophilic $^{18}\text{F}$ -fluorination	Nucleophilic $^{18}\text{F}$ -Fluorination
$[^{18}\text{F}]\text{F}_2$ in gas form - possibility of contamination	$[^{18}\text{F}]\text{F}^-$ in liquid form - less chance of contamination
Molar activity typically in the range of 100-500 MBq/ $\mu\text{mol}$	High molar activity in the range of 500-5000 GBq/ $\mu\text{mol}$
Radiochemical yield (RCY) up to 50% due to the presence of a non-radioactive atom $[^{19}\text{F}]$	Radiochemical yield (RCY) up to 90% as a result of direct binding to precursor molecules
Highly reactive fluorine-18 gas	Less reactive nature of fluorine-18
Several automated synthesis modules (GMP)	Numerous automated synthesis modules (GMP)

## First step

Developing a new and efficient automated radiosynthesis method takes time and therefore, planning is key!

The capacity of the cassette (i.e. the number of reagents and consumables it can hold) is an important consideration when deciding how to best automate a radiosynthesis.

The screenshot displays a software interface for managing sequences. At the top, there are three buttons: "Return", "Open", and "Load". Below these is a central image of a cassette with various valves and ports. To the right of the cassette image is a schematic diagram of the cassette's internal components, including a list of valves (IFP valve 1 to 20, Valve 13 to 20), a pump, oven, and oven cooling system. Below the schematic is a dropdown menu for "Event 221" with options: "Beep", "Trigger", and "Beep". The "Beep" option is selected. Below the dropdown menu are input fields for "Time [s]" (0), "Frequency [Hz]" (300), "Time [ms]" (500), and a "Description" field containing "confirm end of F-MISO". At the bottom right, there are buttons for "Modify", "New", "Delete", "Insert", and "Save".

**Sequence Overview - Synthera\_1\_140219\_F-MISO.sqc [Modified]**

```
214 - Set IFP pressure to 0 kPa ## EtOH in WATER 2 ##
215 - Turn valve 15 to Off and wait 20 s ## EtOH in WATER 2 ##
216 - Turn IFP valve 4 to Off ## EtOH in WATER 2 ##
217 - Set IFP pressure to 300 kPa
218 - Turn pump Off
219 - Turn IFP valve 7 to On ## TRANSFER 2 ##
220 - Turn valve 16 to On and wait 180 s ## TRANSFER 2 ##
221 - Send a beep system ## confirm end of F-MISO transfer ##
222 - Send a beep system ## confirm end of F-MISO transfer ##
223 - Wait for green button and wait 1 s ## confirm end of F-MISO transfer ##
224 - Turn IFP valve 8 to Off ## RESET ##
225 - Turn IFP valve 7 to Off ## RESET ##
226 - Turn IFP valve 6 to Off ## RESET ##
227 - Turn IFP valve 5 to Off ## RESET ##

# R & D Spending and New $^{18}\text{F}$ -radiopharmaceuticals Development

**[ $^{19}\text{F}$ ] $\text{F}^-$  chemistry practices – for analysis of the reaction mixture at different steps of synthesis (before/after fluorination reaction, unhydrolyzed/hydrolyzed intermediate mixture, unpurified product mixture)**

*Before fluorination, after transferring the precursor (at first min)*

*Five min after starting the fluorination*

*At the end of fluorination (after 10 min, post labeled unhydrolyzed intermediate reaction mixture)*

*After drying of the acetonitrile (before hydrolysis)*

# R & D Spending and New <sup>18</sup>F- radiopharmaceuticals Development

*At the end of hydrolysis (hydrolyzed and unpurified mixture)*

*Waste wash out elution sample*

*Final purified product solution*
