## **Betimi i Hipokratit**

*Në çastin kur po hy në radhët e anëtarëve të profesionit mjekësor premtoj solemnisht se jetën time do ta vë në shërbim të humanitetit. Ndaj mësuesve do ta ruaj mirënjohjen dhe respektin e duhur.*

*Profesionin tim do ta ushtroj me ndërgjegje e me dinjitet. Shëndeti i pacientit tim do të jetë brenga ime më e madhe. Do t'i respektoj e do t'i ruaj fshehtësitë e atij që do të më rrëfëhet. Do ta ruaj me të gjitha forcat e mia nderin e traditës fisnike të profesionit të mjekësisë.*

*Kolegët e mi do t'i konsideroj si vëllezër të mi.*

*Në ushtrimin e profesionit ndaj të sëmurit tek unë nuk do të ndikojë përkatësia e besimit, e nacionalitetit, e racës, e politikës, apo përkatësia klasore. Që nga fillimi do ta ruaj jetën e njeriut në mënyrë absolute. As në kushtet e kërcënimit nuk do të lejoj të keqpërdoren njohuritë e mia mjekësore që do të ishin në kundërshtim me ligjet e humanitetit. Këtë premtim po e jap në mënyrë solemne e të lirë, duke u mbështetur në nderin tim personal.*

## **The Oath of Hippocrates**

*Upon having conferred on me the high calling of physician and entering medical practice, I do solemnly pledge myself to consecrate my life to the service of humanity. I will give my teachers the respect and gratitude which is their due. I will practice my profession with conscience and dignity. The health of my patient will be my first consideration. I will respect the secrets which are confided in me, even after the patient has died. I will maintain by all the means in my power, the honor and the noble traditions of the medical profession.*

*My colleagues will be my brothers.*

*I will not permit considerations of religion, nationality, race, party politics or social standing to intervene between my duty and my patient. I will maintain the utmost respect for human life from its beginning even under threat and I will not use my medical knowledge contrary to the laws of humanity. I make these promises solemnly, freely and upon my honor*

## ABSTRACT

Schizophrenia is a chronic mental disorder which represents a clinical syndrome that consists of psychological symptoms and behavioral changes. Findings from worldwide research and literary sources point to the connection between sociodemographic characteristics and schizophrenic disorders.

Goal: To analyze the role that sociodemographic characteristics (gender, age, marital status, educational degree, employment and social status) have in patients with acute and chronic diagnosis of schizophrenia.

Method: This research represents a retrospective and prospective study, based on the data collected from patients that have been and are still being treated in the Psychiatric Hospital “Skopje” in Skopje. This was done thanks to the official approval and cooperation of the management team of the hospital. The data is collected from 2387 patients with chronic and acute conditions of the illness. These patients were hospitalized in the period between January 2019, to December 2022, and they have been diagnosed with schizophrenia according to the International Classification of Illnesses (ICD). The identity of the patients is protected and their data were collected and analyzed using identification codes. The statistical analysis on the data was done using the software SPSS (Statistical Package for the Social Science, version 20).

Results: The total number of patients who received treatment for schizophrenia during the time period 2019-2022 is 2387 patients. The first group consists of 558 patients with a diagnosis of their first schizophrenia episode out of which 429 (77.0%) are men and 129 (23.0%) are women. The second group is consisted of 1829 patients with chronic schizophrenia out of which 1396 (71.0%) are men and 523 (29.0%) are women. The results show that in the cases of acute schizophrenia, the biggest number of patients fall in the age ranges between 20-29 & 30-39 years of age, while in the group of chronic patients, they are aged 40-49 years old, and above 50. Our results indicate that schizophrenia is more likely to happen to people who live in urban cities. Regarding educational status, the highest number of patients are those with high school and/or elementary school education, while regarding their employment status, most of the subjects are unemployed, retired or are beneficiaries of social aid.

Conclusion: The represented data shows that age, gender, marital status, education, and employment status are related to schizophrenia. With adequate psychiatric and psychological help, in the form of counseling and psychotherapeutic treatment, the patients can be helped to more easily accept and overcome the illness. These results can be of help to the families of those suffering from schizophrenia, but also to the professionals who work with treating schizophrenia, through the form of counseling, therapy and adapting to the illness, in creating a new lifestyle, and promoting and sustaining mental health.

Key words: schizophrenic disorder, patients, sociodemographic characteristics, prevention, mental health.

## INTRODUCTION

Schizophrenia is a chronic mental disorder that represents a clinical syndrome that consists of psychological symptoms and behavioral changes. In the heterogeneous clinical condition of the illness, the following symptoms can be found: hallucinogenic perceptions, dark thoughts and beliefs, reduction of emotional experiences and feelings of pleasure, various cognitive difficulties related to memory and basic functioning, characteristic behavior that is related to psychotic experiences and difficulties with self-control and everyday functioning [5].

Although today we approach schizophrenia as a singular entity, it consists of a number of heterogeneous, still unknown disorders. In addition to the analyzed characteristics, there is data related to the individual presentation of the illness, the response to the treatment, the course of the illness, as well as the capability of the patient to function socially [12]. The risk of suffering from schizophrenia varies from 0.3 to 3.7 percent, depending on the definition and diagnostic criteria. The average risk from schizophrenia in the general population is around 1 percent, while the incidence is around 15 people out of 100 000 [13]. The disorder itself most often manifests between 20 and 35 years of age, so this period is related to a high risk of its appearance [2]. Meanwhile, in 25 percent of the patients it shows up in the period between puberty, to 30 years of age [3], in 25 percent it shows up between 30 and 40 years of age, in 16-18% above 40 years of age, and only in 2-3 % before reaching 15 years of age. If psychosis shows up around or later than 50 years of age, it is considered that the disorder itself is caused by alcohol and/or substance abuse. That is why it is said that the end of adolescence and the start of maturity, the critical years for social and professional development of any human being, is the riskiest period for the appearance of schizophrenia. Around 40 percent (men) and 23 percent (women) from the cases analyzed, schizophrenia shows up before reaching 19 years of age [10]. The illness manifests earlier on in men than in women. It often shows up in the adolescent period, all the way to a more mature age, from 16 to 35 years old, where there is a steep increase of the frequency in which the illness appears. More specifically, that is a 50 percent increase around the age of 25, and after 40 years of age, the percentage of appearance decreases [11]. It also shows up a lot more frequently in urban cities and environments, than in rural ones. The life expectancy of those who suffer from schizophrenia for about 20 to 30 years, compared to those from the

general population, as well as to the environments with lower socioeconomic status [6,9].

A large number of research papers show the connection between the sociodemographic characteristics and the course of the illness, specifically the acute and chronic phases in which the positive and negative symptoms are dominating. The positive or psychotic symptoms of schizophrenia are related to delusional ideas, illogical speech and expressions, and hallucinations. The negative symptoms are decreased motivation, lack of willpower, emotional numbness and lack of speech [8]. That is why early treatment is crucial for patients suffering from schizophrenia, and it is necessary to start antipsychotic and psychosocial interventions on time, so that the course of the illness can be influenced on early on.

## GOALS OF THE RESEARCH

To make a selection of patients suffering from schizophrenic disorders from the total pool of subjects

To analyze the frequency of schizophrenic disorders; to determine in which year they are most present; to determine whether the appearance rate grows or decreases in the period between 2019-2022

To determine the role of the sociodemographic characteristics (gender, age, marital status, educational status, employment and social status) in patients with an acute and chronic course of the disease

Based on the results of the research, to take measures for appropriate prevention through appropriate treatments, counseling, rehabilitation, during which the medical nurse as part of the multidisciplinary team will have an appropriate role and task.

## METHOD

This research represents a retrospective and prospective study, based on the data collected from patients that have been and are still being treated in the Psychiatric Hospital "Skopje" in Skopje. This was done thanks to the official approval and cooperation of the management team of the hospital. The data is collected from 2387 patients with chronic and acute conditions of the illness. These patients were hospitalized in the period between January 2019, to December 2022, and they have been diagnosed with schizophrenia according to the International Classification of Illness (ICD).

Afterwards, based on the data from the illness histories,

structured clinical interviews, and the sociodemographic data received when admitting the patients, there was a conducted analysis of the frequency of appearance of the schizophrenic disorders during the aforementioned time periods, and the distribution of the specified sociodemographic characteristics. Also, a comparison has been done between the patients suffering from an acute and chronic course of the illness, in order to conclude whether there are any differences based on the sociodemographic characteristics.

The identity of the patients is protected and their data were collected and analyzed using identification codes. The statistical analysis on the data was done using the software SPSS (Statistical Package for the Social Science, version 20).

### RESULTS

Based on the data from our research, we can see that during 2019 in the Psychiatric Hospital “Skopje” in Skopje, there was a total of 704 patients with schizophrenic disorder out of which 141 (20%) were acute, and 563 (80%) were chronic patients. During 2020, out of 602 patients, 149 (25%) were acute and 453 (75%) were chronic. In 2021, a total of 566 patients were admitted, out of which 128 (22%) were acute, and the other 438 (78%) were chronic. In 2022, the total number saw a decrease to 515 patients in total, out of which 140 (27%) were acute and 375 (73%) were chronic patients. It is noticeable that with each consecutive year, the percentage of chronic patients decreases compared to the acute patients.

Graph1. Total number of patients in the period 2019 – 2022 divided by duration of illness

On Table1, there is a representation of the total number of patients in the time period between the years 2019-2022, in regards to gender. The analyzed group consists of a total of 2387 patients divided into two groups. The first group consists of 558 patients with a diagnosis of

their first schizophrenia episode out of which 429 (77.0%) are men and 129 (23.0%) are women. The second group is consisted of 1829 patients with chronic schizophrenia out of which 1396 (71.0%) are men and 523 (29.0%) are women. The results indicate that the incidence of schizophrenia is much more present in men than in women.

Table 1. Frequency and percentage of respondents among gender

Gender	Acute Frequency/Percentage	Chronic Frequency/Percentage
Men	429 ( 77.0 %)	1306 (71.0%)
Female	129 (23.0 %)	523 (29.0%)
Total	558 ( 100%)	1829 ( 100%)

Because schizophrenia appears in different stages of life, on Graph2 we have presented the structure of both groups based on their age at the time of treatment. From the results, we can conclude that the patients with acute schizophrenia, mostly belong to the ranges between 20-29 and 30-39 years of age, while in the second group there is a higher percentage of patients in the age ranges of 40-49, and 50 years and older.

Graph 2. Total number of patients in the period 2019 – 2022 divided by age

From the analysis done on the data, we can see that in our pool of subjects in the acute group, the larger number of patients are in the category of those with high school education and elementary school education levels, while a small number of the patients are university graduates. On the other hand, in patients with chronic illness, the larger number are patients who have not finished elementary school (Table3).

Table 2. Educational status of respondents in acute phase

Education/acute	2019 year Frequency/ Percentage	2020 year Frequency/ Percentage	2021year Frequency/ Percentage	2022year Frequency/ Percentage
Without	2 (1.0%)	5 (3.0%)	3 (2.0%)	4 (3.0%)
Primary	51 (36.0%)	53 (36.0%)	39 (30.0%)	45 (32.0%)
Secondary	74 (53.0%)	83 (56.0%)	80 (63.0%)	88 (63.0%)
High	14 (10.0%)	8 (5.0%)	6 (5.0%)	3 (2.0%)
Total	141 (100 %)	149 (100 %)	128 (100%)	140 (100 %)

Table 3. Educational status of respondents in chronic phase

Education/chronic	2019 year Frequency/ Percentage	2020 year Frequency/ Percentage	2021year Frequency/ Percentage	2022 year Frequency/ Percentage
Without	201 (36.0%)	124 (28.0%)	106 (25.0%)	87 (23.0%)
Primary	164 (30.0%)	80 (18.0%)	123 (28.0 %)	136 (36.0%)
Secondary	173 (30.0%)	220 (48.0%)	181 (41.0%)	135 (36.0%)
High	25 (4.0%)	29 (6.0%)	28 (6.0%)	17 (5.0%)
Total	563 (100%)	453 (100%)	438 (100%)	375 (100%)

It is known that a person's vocation helps shape the character, structure and lifestyle of an individual. It represents a relationship to society through which a person secures their economic existence and their social status. In our research done on both groups of patients, the percentage of unemployed or retired people is larger than the percentage of employed people (Graph3). In the group of chronic patients, it can be noticed that a large number of them are in socially vulnerable categories and are receiving aid.

Graph 3. Total number of patients in the period 2019 - 2022divided according to working status

The results from our research shows that out of the total number of acute patients, a good number of them fall under the married category, while the largest percentage of them are people who are single (Table4). The same can be seen for chronic patients, where throughout the years, those who are single are in the overwhelming majority of the patients.

On Graph 4, there is a representation of the patient statistics according to the place where they live. It is

noticeable that the number of patients from Skopje (the capital city) is significantly larger than other smaller and rural areas.

Graph 4. Total number of patients in the period 2019 - 2022 divided according to the place of residence

## DISCUSSION

Schizophrenia represents a chronic mental disorder, a clinical syndrome where there are specific psychological symptoms present, individual variations regarding the clinical state, response to treatment and course of the illness, as well as reduced functional capacity in personal, family, professional and social aspects of life. It begins with a long asymptomatic period - from birth to adolescence - a period in which the functioning of the individual is healthy. Then the prodromal stage appears - the time of early adolescence and the early twenties of one's life - which is characterized by unusual behavior and non-specific negative symptoms with a mild decrease in functional capacity of the individual. Afterwards, the acute phase begins - the period between twenties and thirties - when the positive psychotic symptoms of the illness come to light, as well as remissions and relapses, most often without gaining back the level of functioning before the onset of the illness [4]. The last stage of the illness begins after the fortieth year of age, when negative and cognitive symptoms occur more often, with an occasional improvement of the clinical state. There is a gradual reduction of the patient's functional capacities on a social level, as well as therapeutic resistance to neuroleptic therapy, as well as to psychosocial interventions, which points to the chronic course of the illness.

Sociodemographic factors such as age, gender, marital status, education, employment status and income, are continually identified as important factors in explaining the variability of schizophrenia and its rate of prevalence. Our research results confirm the probability that schizophrenia is a lot more likely to occur in men than

in women, that is more often comes up in people who live in urban areas, while regarding educational levels, it is more common around people with lower educational history. A large number of authors also point out in their papers that schizophrenia is more likely to affect people with low income and a lower level of education [14]. Our research also showed that among our pool of patients, the dominating number of patients are unemployed, retired, or receiving social aid, especially when it comes to chronic patients.

That is why it is necessary to begin treatment of schizophrenia early on, using antipsychotic therapy and psychosocial interventions, so that the natural course of the illness can be influenced better [1]. The role of the medical nurse in treatment of schizophrenia patients is essential, as they take care of the patients, communicate with them, evaluate their needs, and reacts correspondingly in order to establish a relationship which is very important in their recovery process.

## CONCLUSION

Contemporary psychiatry and psychology today are trying to integrate the different psychological theories and concepts with the contemporary neurophysiological discoveries. This is the basis of all trials and tendencies to integrate different psychotherapeutic and pharmacological interventions. Based on the most recent psychological theories, it is considered that psychological phenomena that appear in somatic and mental disorders, appear because of disrupted self-regulation of the individual. Our internal life, our emotions, imaginations and thoughts affect us and our behavior. The internal life of a person is an important source of their actions, reactions and behavior in general. This concept responds to the latest discoveries, and it is going to enter a phase of development of discovery and better research, based on recent evidence. This would give more specific answers to the current enigma of the relations and mutual influence of the psychological and biological, and the somatic and cerebral, with the functioning, reacting and general behavior of a person.

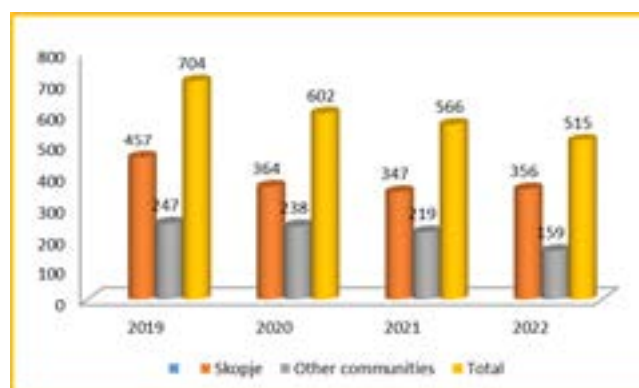

The results in our research can be of significance for preventing, discovering and treating schizophrenic disorders. These results can be directed towards helping cure schizophrenic illness, in order to prevent or overcome negative consequences. With adequate psychiatric and psychological help, in the form of counseling and psychotherapy, the patients can be helped

to more easily accept and overcome the illness. These results can also be of help to the families of patients, as well as to professionals who are dealing with treatment of schizophrenia, through counseling and therapy for adapting to the illness, in creating new lifestyles, and regular use of neuroleptic therapy [7].

That is why it is of great importance to form mental health centers which are meant to stimulate patients in taking part of different activities that will aid their rehabilitation, resocialization, and recreation. Also, for providing them with psychopharmacological therapy, advice, interventions in states of crisis, opportunities to meet up with friends, and activities for prequalification, as well as various forms of support for achieving their own potential.
