$^{90}\text{Y}$  is a radioisotope and decay product of  $^{90}\text{Sr}$  for therapeutic purpose due to its suitable half-life  $T_{1/2}=64.1\text{h}$ . The half-life of  $^{90}\text{Sr}$  is longer ( $T_{1/2}=28,9$  years) and have a high skeleton uptake. To obtain a radionuclide with a high level of purity is necessary to separate  $^{90}\text{Y}$  from the bulk of  $^{90}\text{Sr}$ . The most promising approach to separate  $^{90}\text{Y}$  from the bulk of  $^{90}\text{Sr}$  is using the electrochemical  $^{90}\text{Sr}/^{90}\text{Y}$  generator.

The separation is based on the selective deposition of  $^{90}\text{Y}$  on a platinum electrode. This is attributed to the difference in electrode potential of  $\text{Sr}^{2+}$  and  $\text{Y}^{3+}$  ions in acidic media.

## Electrochemical separation involved two electrolysis cycles:

### separation of $^{90}\text{Y}$ from $^{90}\text{Sr}$

(platinum electrodes like anode and cathode. Selective electrochemical deposition of  $^{90}\text{Y}$  on platinum electrode at pH 2-3, potential -2.5V)

### purification of $^{90}\text{Y}$

(anode is the cathode from the first cycle and cathode is circular platinum electrode.  $^{90}\text{Y}$  was deposited on circular platinum cathode at pH 2-3, potential -2.5V)

Fig. 1  $^{90}\text{Sr}/^{90}\text{Y}$  generator

## Optimization of the parameters of electrolysis for the separation of $^{90}\text{Y}$ from $^{90}\text{Sr}$ :

maximum deposition at -2.5V (Table 1) and pH 2.5–3.0 (Fig. 2)

Applied potential (V)	Electrodeposition of $^{90}\text{Y}$ (%)
-1.0	4±2
-1.5	53±3
-2.0	80±3
-2.5	97±2
-3.0	>99 co-deposition of $^{90}\text{Sr}$ at this voltage.

Table. 1 Dependence of deposition from potential

## Conclusion

Electrochemical separation of  $^{90}\text{Y}$  from  $^{90}\text{Sr}$  with  $^{90}\text{Sr}/^{90}\text{Y}$  generator is of high importance for radiopharmacy and for obtaining a pure  $^{90}\text{Y}$ , who can be used for radiolabeling of various targeting molecules for the treatment of cancer.
